

**Mrs. Bailey's 'Handbook of Birds of the Western United States.'**<sup>1</sup>—The popularity of Mrs. Bailey's standard work on the birds of our western states is attested by the fact that a seventh revised edition has just been published by the Riverside Press. Since the appearance of the fourth edition, which was noticed in these columns in January, 1915, additions appear in the list of species to be added, while the list of proposed changes in the A. O. U. Check-List published in 'The Auk' for October, 1916, are printed in so far as they apply to western birds. The 'List of Birds of the Western United States in the Nomenclature of the 1910 Check-List' now appears under the caption 'Revised Ranges of Western Birds,' and contains additional matter. There are also many additional titles in the supplement to the list of 'Books of Reference.'

All of these additions tend to bring the work up to date and give us the very latest information on the birds of the west, a region in which bird students are increasing at a wonderful rate, while its avifauna is steadily becoming of greater interest to eastern bird students owing to the increasing travel in the west during recent years.—W. S.

**Dr. Casey A. Wood on the Fundus Oculi of Birds.**<sup>2</sup>—There are many points in the anatomy and physiology of birds upon which the ornithologist needs light but which he finds himself unfitted to investigate because of his lack of technical training in these special lines of research. This is of course perfectly natural as ornithology like any other branch of systematic zoölogy is so broad a subject and so intricately related to various special lines of investigation that no one man could possibly speak authoritatively upon all its aspects. It is fortunate therefore that specialists upon anatomy, physiology, etc., who lay no claim to being ornithologists, are willing from time to time to give us the benefit of their special training, and to elaborate the particular line of research to which they have devoted their lives, in its relationship to ornithology.

In studying the systematic relationship of any group of birds or the behaviour of a certain species, the ornithologist may have occasion to consider the power of hearing or sight, but without the special or technical training possessed by the medical practitioner who has specialized upon these subjects his deductions are likely to be faulty if not absolutely absurd. With the results of the specialists' researches before him however, he can make use of data on these topics without danger of error.

One special work of the kind we have in mind which might be mentioned
